CONTENTS

1. Introduction

FORESEE eMMC is an embedded storage solution designed in the BGA package. The FORESEE eMMC consists of NAND flash and eMMC controller. The controller could manage the interface protocols，wear-leveling，bad block management and ECC.

FORESEE eMMC has high performance at a competitive cost, high quality and low power consumption，and eMMC is compatible with JEDEC standard eMMC 5.1 specifications.

2. Product List

Density	Part Number	NAND Flash Type	Capacity (User Density: 90%)	Package Size(mm)	Package Type
32GB	FSEWASLG-32G	256Gb x1	28.8GB	11.5x13x1.2	153FBGA
64GB	FSEWASLG-64G	256Gb x2	57.6GB	11.5x13x1.2	153FBGA
128GB	FSEWASLG-128G	256Gb x4	115.2GB	11.5x13x1.2	153FBGA

3. Features

- **eMMC5.1 specification compatibility**
  (Backward compatible to eMMC4.41/4.51/5.0)
- **Bus mode**
  - Data bus width: 1 bit (default), 4 bits, 8 bits
  - Data transfer rate: up to 200MB/s (HS200)
  - MMC I/F Clock frequency：0~200MHz
- **Operating voltage range**
  - Vcc(NAND)：2.7 ~ 3.6V
  - Vccq(Controller)：1.7 ~ 1.95V / 2.7 ~ 3.6V
- **Temperature**
  - Operation (-40℃ ~ +85℃)
  - Storage without operation (-40℃ ~ +85℃)
- **Sudden-Power-Loss safeguard**
- **Hardware ECC engine**
- **Unique firmware backup mechanism**
- **Global-wear-leveling**
- **Supported features.**
  - Up to 200MB/s at 200MHz HS200 mode
  - Partitioning, RPMB
  - Boot feature, boot partition
  - HW Reset/SW Reset
  - Discard, Trim, Erase, Sanitize
  - Background operations, HPI
  - Enhanced reliable write
  - S.M.A.R.T. Health Report
  - FFU
  - Sleep / awake
- **Others**
  - Compliance with the RoHS Directive

4. Functional Description

FORESEE eMMC with powerful L2P (Logical to Physical) NAND Flash management algorithm provides unique functions:

- Host independence from details of operating NAND flash
- Internal ECC to correct defect in NAND flash
- Sudden-Power-Loss safeguard

  To prevent from data loss, a mechanism named Sudden-Power-Loss safeguard is added in the eMMC. In the case of sudden power-failure, the eMMC would work properly after power cycling.
- Global-wear-leveling

  To achieve the best stability and device endurance, this eMMC equips the Global Wear Leveling algorithm. It ensures that not only normal area, but also the frequently accessed area, such as FAT, would be programmed and erased evenly.
- IDA(Initial Data Acceleration)

  The eMMC prevents the pre-burned data from data-loss with IDA, in case of our customer had pre-burned data to eMMC, before the eMMC being SMT.
- Cache

  The eMMC enhanced the data written performance with Cache, with which our customer would get more endurance and reliability.
- DEVICE TYPE

Bit	Device Type	Supportability
7	HS400 Dual Data Rate eMMC at 200 MHz – 1.2 V I/O	Not support
6	HS400 Dual Data Rate eMMC at 200 MHz – 1.8 V I/O	Not support
5	HS200 Single Data Rate eMMC at 200 MHz - 1.2 V I/O	Not support
4	HS200 Single Data Rate eMMC at 200 MHz - 1.8 V I/O	support
3	High-Speed Dual Data Rate eMMC at 52 MHz - 1.2 V I/O	Not support
2	High-Speed Dual Data Rate eMMC at 52 MHz - 1.8 V or 3 V I/O	support
1	High-Speed eMMC at 52 MHz - at rated device voltage(s)	support
0	High-Speed eMMC at 26 MHz - at rated device voltage(s)	support

5. Product Specifications

5.1 Performance

Part Number	Write	Read
FSEWASLG-32G	Up to 110MB/s	Up to 140MB/s
FSEWASLG-64G	Up to 125MB/s	Up to 155MB/s
FSEWASLG-128G	TBD	TBD

- Test Condition: Bus width x8, 200MHz SDR, 512KB data transfer, w/o file system overhead, measured on internal board
- Test tool: uBOOT (Without O/S)
- Chunk size: 1MB,
- Test area: 100MB/ Full-range of LBA.

5.2 Power Consumption

5.2.1 Active power consumption during operation

Part Number	Icc	Iccq
FSEWASLG-32G	70mA	100mA
FSEWASLG-64G	80mA	110mA
FSEWASLG-128G	TBD	TBD

- Power Measurement conditions: Bus configuration =x8 @200MHz SDR, 23℃.
- Vcc:3.3V & Vccq：1.8V
- The measurement for max RMS current is the average RMS current consumption over a period of 100ms.

5.2.2 Low power mode(stand-by)

Part Number	Icc	Iccq
FSEWASLG-32G	70uA	200uA
FSEWASLG-64G	100uA	200uA
FSEWASLG-128G	TBD	TBD

- Power Measurement conditions: Bus configuration =x8 @200MHz SDR, 23℃.
- Standby: NAND Vcc & Controller Vccq power supply is switched on.
- The measurement for max RMS current is the average RMS current consumption over a period of 100ms.

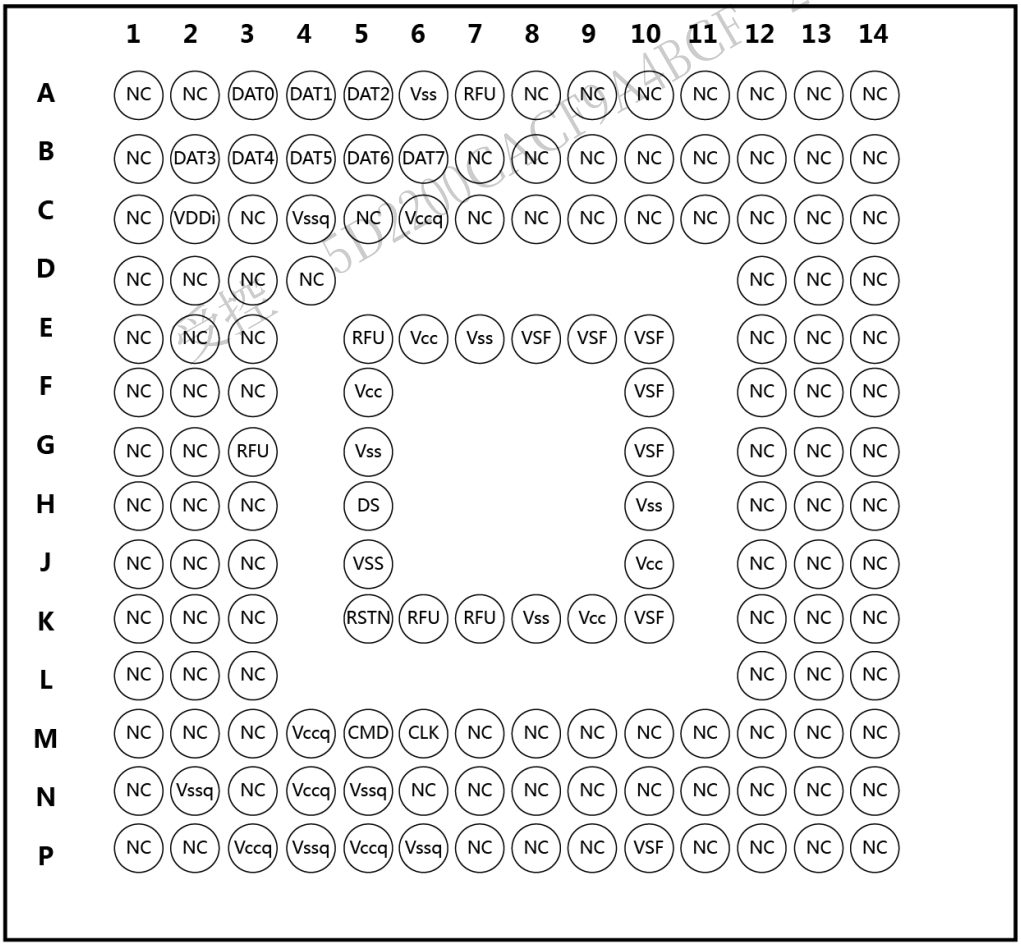
5.2.3 Low power mode(sleep)

Part Number	Icc	Iccq
FSEWASLG-32G	0	200uA
FSEWASLG-64G	0	200uA
FSEWASLG-128G	0	TBD

- Power Measurement conditions: Bus configuration =x8 @200MHz SDR, 23℃.
- Sleep: NAND Vcc power supply is switched off（Controller Vccq on）
- The measurement for max RMS current is the average RMS current consumption over a period of 100ms.

6. Pin Assignments

6.1 Ball Array view



FBGA153 - Ball Array (Top View through package)

6.2 Pin Assignment

Signal	Description
CLOCK (CLK)	Each cycle of the clock directs a transfer on the command line and on the data lines.
COMMAND (CMD)	This signal is a bidirectional command channel used for device initialization and command transfer. The CMD Signal has 2 operation modes: open drain, for initialization, and push-pull, for command transfer. Commands are sent from the host to the device, and responses are sent from the device to the host.
DATA (DAT0-DAT7)	These are bidirectional data signal. The DAT signals operate in push-pull mode. By default, after power-up or RESET, only DAT0 is used for data transfer. The controller can configure a wider data bus for data transfer wither using DAT [3:0](4bit mode)or DAT[7:0](8bit mode). Includes internal pull-up resistors for data lines DAT[7:1].Immediately after entering the 4-bit mode, the device disconnects the internal pull-up resistors on the DAT1 and DAT2 lines.(The DAT3 line internal pull-up is left connected.)Upon entering the 8bit mode, the device disconnects the internal pull-up on the DAT1, DAT2, and DAT[7:4]lines.
Data Strobe (DS)	Newly assigned pin for HS400 mode. Data Strobe is generated from eMMC to host. In HS400 mode, read data and CRC response are synchronized with Data Strobe.
RESET (RSTN)	Hardware Reset Input
Vccq	Vccq is the power supply line for host interface, have two power mode: High power mode:2.7V~3.6V; Lower power mode:1.7V~1.95V
Vcc	Vcc is the power supply line for internal flash memory, its power voltage range is:2.7V~3.6V
VDDi	VDDi is internal power node, not the power supply. Connect 1uF capacitor VDDi to ground
Vss,Vssq	Ground lines.

Note:

NC: No Connect, shall be connected to ground or left floating.

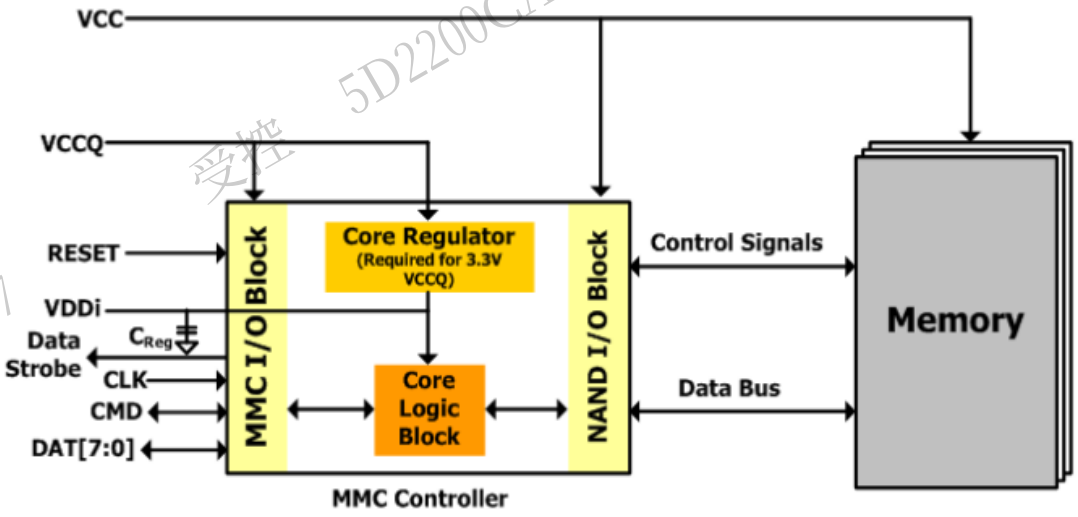
RFU: Reserved for Future Use, must be left floating for future use.

VSF: Vendor Specific Function, must be left floating.

7. Usage Overview

7.1 General description

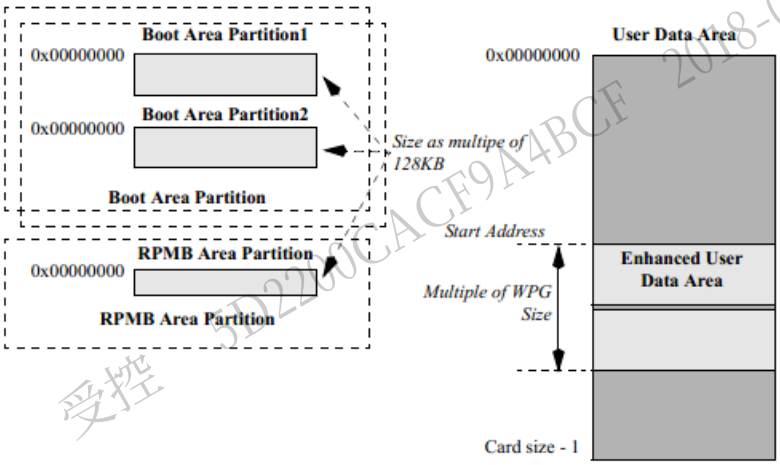
The eMMC can be operated in 1, 4, or 8-bit mode. NAND flash memory is managed by a controller inside, which manages ECC, wear leveling and bad block management. The eMMC provides easy integration with the host process that all flash management hassles are invisible to the host.



7.2 Partition Management

The embedded device offers also the possibility of configuring by the host additional split local memory partitions with independent addressable space starting from logical address 0x00000000 for different usage models. Default size of each Boot Area Partition is 4096 KB and can be changed by Vendor Command as multiple of 128KB. Boot area partition size is calculated as (128KB * BOOT_SIZE_MULTI) The size of Boot Area Partition 1 and 2 cannot be set independently and is set as same value Boot area partition which is enhanced partition. Therefore memory block area scan is classified as follows:

- Factory configuration supplies boot partitions.
- **The RPMB partition is 4MB.**
- The host is free to configure one segment in the User Data Area to be implemented as enhanced storage media, and to specify its starting location and size in terms of Write Protect Groups. The attributes of this Enhanced User Data Area can be programmed only once during the device life-cycle (one-time programmable).
- Up to four General Purpose Area Partitions can be configured to store user data or sensitive data, or for other host usage models. The size of these partitions is a multiple of the write protect group. Size and attributes can be programmed once in device life-cycle (one-time programmable). Each of the General Purpose Area Partitions can be implemented with enhanced technological features.

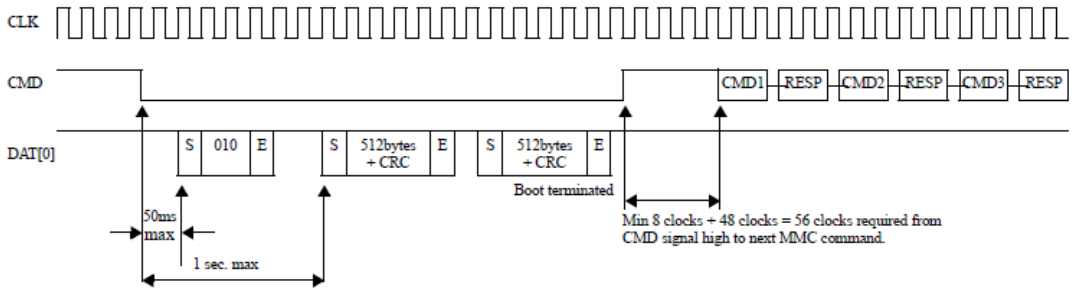


Partitions and user data area configuration

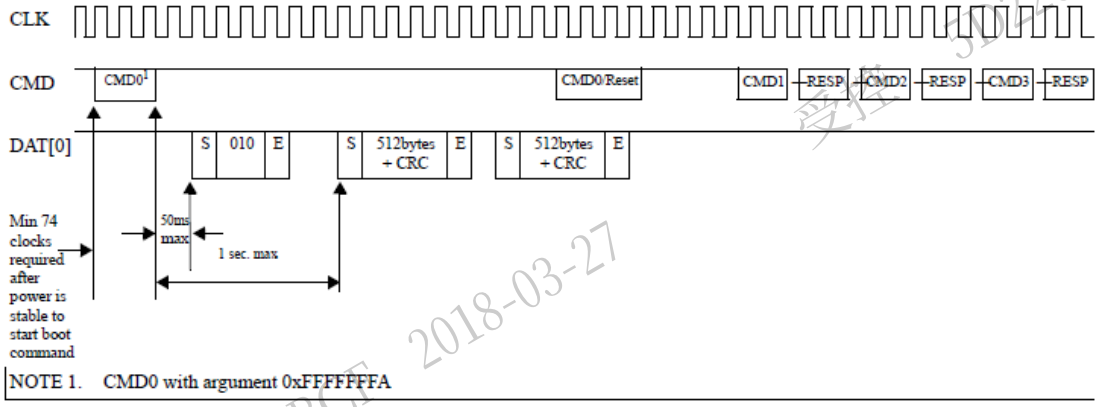
(The size of RPMB area partition is 4MB)

In boot operation mode, the master can read boot data from the slave (device) by keeping CMD line low or sending CMD0 with argument + 0xFFFFFFFA, before issuing CMD1. The data can be read from either boot area or user area depending on register setting.

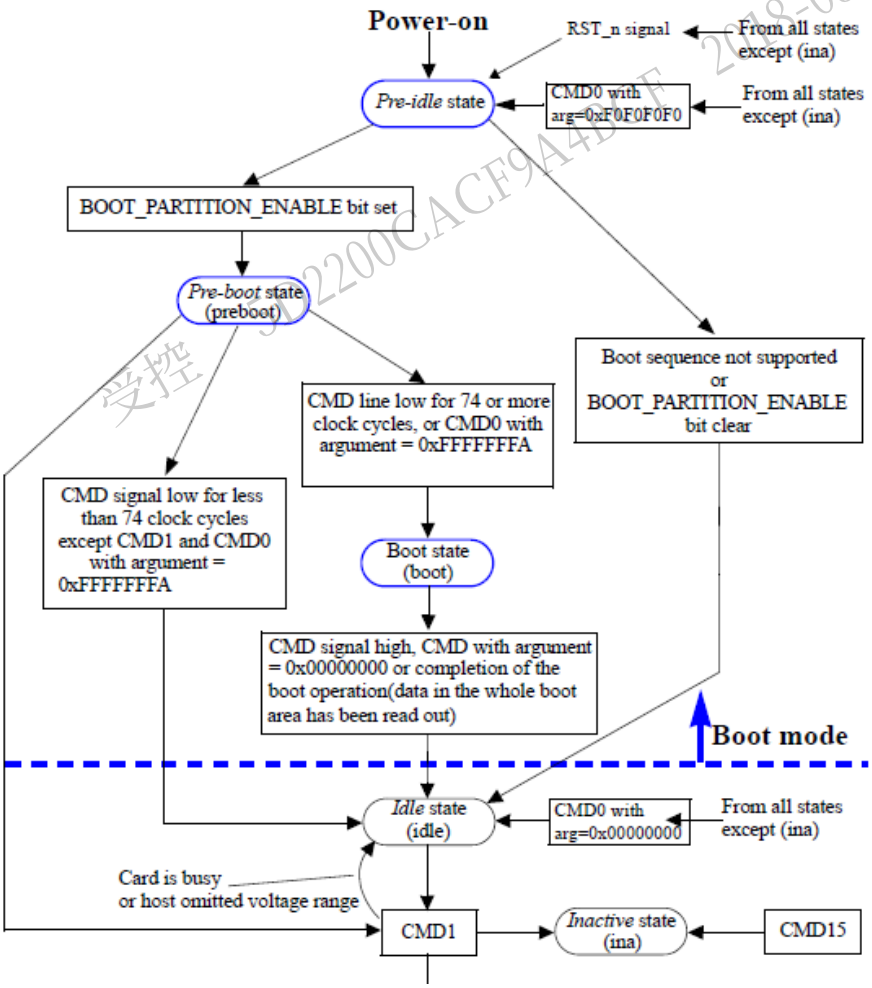
Timing Factor	Value
Boot ACK Time	< 50 ms
Boot Data Time	< 1 s
Initialization Time	< 1 s



State diagram (boot mode)



State diagram (alternative boot mode)



State diagram (boot mode)*

7.3 Automatic Sleep Mode

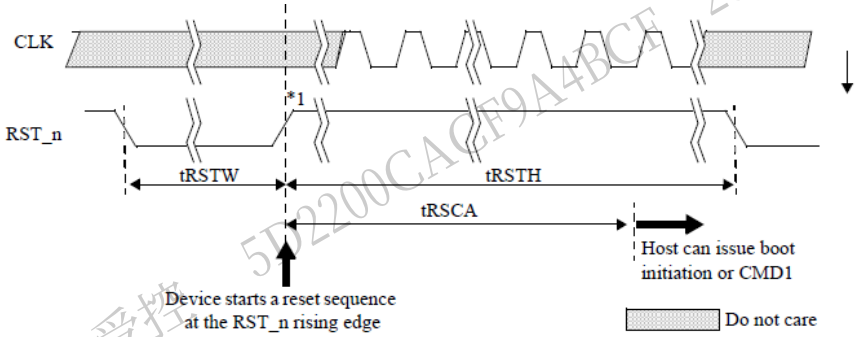
If host does not issue any command during certain duration **(1s)**, after previously issued command is completed, the device enters "Power Saving mode" to reduce power consumption. At this time, commands arriving at the device while it is in power saving mode will be serviced in normal fashion. The below table explains the condition to enter and exit Auto Power Saving Mode

7.4 Sleep (CMD5)

A card may be switched between a Sleep state and a Standby state by SLEEP/AWAKE (CMD5). In the Sleep state the power consumption of the memory device is minimized. In this state the memory device reacts only to the commands RESET (CMD0 with argument of either 0x00000000 or 0xF0F0F0F0 or H/W reset) and SLEEP/AWAKE (CMD5). All the other commands are ignored by the memory device. The timeout for state transitions between Standby state and Sleep state is defined in the EXT_CSD register S_A_timeout. The maximum current consumptions during the Sleep state are defined in the EXT_CSD registers S_A_VCC and S_A_VCCQ. Sleep command: The bit 15 as set to 1 in SLEEP/ AWAKE (CMD5) argument. A wake command: The bit 15 as set to 0 in SLEEP/AWAKE (CMD5) argument.

7.5 H/W Reset operation

Device will detect the rising edge of RST_n signal to trigger internal reset sequence



H/W reset waveform

7.6 High-speed mode selection

After the host verifies that the card complies with version 4.0, or higher, of this standard, it has to enable the high speed mode timing in the card, before changing the clock frequency to a frequency higher than 20MHz. For the host to change to a higher clock frequency, it has to enable the high speed interface timing. The host uses the SWITCH command to write 0x01 to the HS_TIMING byte, in the Modes segment of the EXT_CSD register.

7.7 Bus width selection

After the host has verified the functional pins on the bus it should change the bus width configuration accordingly, using the SWITCH command. The bus width configuration is changed by writing to the BUS_WIDTH byte in the Modes Segment of the EXT_CSD register (using the SWITCH command to do so). After power-on, or software reset, the contents of the BUS_WIDTH byte is 0x00.

7.8 Partition configuration

Model	Area/Partition	Size (GB)	Size (MB)	Size (Sector)	Size (Byte)	Size (Hex,Byte)
FSEWASLG-32G	User	28.8GB	29600	60620800	31037849600	73A000000
	Boot Partition 1	-	4	8192	4194304	400000
	Boot Partition 2	-	4	8192	4194304	400000
	RPMB	-	4	8192	4194304	400000

	RPMB	-	4	8192	4194304	400000

7.9 CID register

The Card Identification (CID) register is 128 bits wide. It contains the card identification information used during the card identification phase (protocol). Every individual flash or I/O card shall have an unique identification number. Every type of ROM cards (defined by content) shall have a unique identification number. The structure of the CID register is defined in the following sections.

Name	Field	Width	CID-slice	CID Value	Remark
Manufacturer ID	MID	8	[127:120]	88h	
Reserved	-	6	[119:114]	--	
Card/BGA	CBX	2	[113:112]	01h	BGA
OEM/Application ID	OID	8	[111:104]	03h	
Product name	PNM	48	[103:56]	0x4E4361726420

Not used, always '1'	-	1	[0:0]	--	

7.10 CSD register

The Card-Specific Data (CSD) register provides information on how to access the card contents. The CSD defines the data format, error correction type, maximum data access time, data transfer speed, whether the DSR register can be used etc. The programmable part of the register (entries marked by W or E, see below) can be changed by CMD27. The type of the CSD Registry entries coded as follows:

Name	Field	Width	Cell Type	CSD-slice

7.11 Extended CSD register

The Extended CSD register defines the card properties and selected modes. It is 512 bytes long. The most significant 320 bytes are the Properties segment, which defines the card capabilities and cannot be modified by the host. The lower 192 bytes are the Modes segment, which defines the configuration the card is working in. These modes can be changed by the host by means of the SWITCH command.

Notes: 1. R= Read-only

R/W=One-Time Programmable and readable

R/W/E=Multiple writable with value kept after a power cycle, assertion of the RST_n signal, and any CMD0 reset, and readable

TBD=To Be Defined.

2. Reserved bits should be read as 0.

7.12 OCR Register

The 32-bit operation conditions register stores the VCCQ voltage profile of the eMMC. In addition, this register includes a status information bit. This status bit is set if the eMMC power up procedure has been finished. The OCR register shall be implemented by eMMC.

OCR bit	VCCQ voltage window	eMMC
[6:0]	Reserved	000 0000b
[7]	1.7–1.95	1b
[14:8]	2.0–2.6	000 0000b
[23:15]	2.7–3.6	1 1111 1111b
[28:24]	Reserved	000 0000b
[30:29]	Access Mode	00b (byte mode)/10b (sector mode)
[31]	power up status bit (busy)*	

Note*: This bit is set to LOW if the eMMC has not finished the power up routine. The supported voltage range is coded as shown in table.

7.13 Field firmware update(FFU)

To download a new firmware, the controller requires instruction sequence following JEDEC standard. Longsys eMMC only supports Manual mode (MODE_OPERATION_CODES is not supported). For more details, refer to the App note.

Longsys eMMC (FSEWASLG-xxG) Field F/W update flow – CMD sequence

Operation	CMD	Remark
Set block length 512B	CMD16, arg : 0x00000200	
Enter FFU mode	CMD6, arg : 0x031E0100	
Send FW to device(Download)	CMD25, arg : 0x00000000	Sending CMD25 is followed by sending FW data ,The whole data should be sent by one CMD25
CMD12 : Stop	CMD12, arg : 0x00000000	
CMD6 : Exit FFU mode	CMD6, arg : 0x031E0000	
HW Reset/Power cycle		CMD0 Reset is not support
Re-Init to trans state	CMD0, CMD1 ...	
Check if FFU is succeeded	CMD8, arg : 0x00000000	Check EXT_CSD[26] : FFU_SUCCESS If FFU_SUCCESS is 0, FFU is succeeded, otherwise FFU is failed. Do not verify data with CMD17/CMD18 while FFU mode.

SUPPORTED_MODE[493] (Read Only)

BIT[0] : '0' FFU is not supported by the device.

'1' FFU is supported by the device.

BIT[1] : '0' Vendor specific mode (VSM) is not supported by the device.

'1' Vendor specific mode is supported by the device.

Bit	Field	Supportability
Bit[7:2]	Reserved	-
Bit[1]	VSM	Not support
Bit[0]	FFU	Support

FFU_FEATURE[492] (Read Only)

BIT[0] : '0' Device does not support MODE_OPERATION_CODES field (Manual mode)

'1' Device supports MODE_OPERATION_CODES field (Auto mode)

Bit	Field	Supportability
Bit[7:1]	Reserved	-
Bit[0]	SUPPORTED_MODE_OPERATION_CODES	Not support

FFU_ARG[490-487] (Read Only)

Using this field the device reports to the host which value the host should set as an argument for read and write commands in FFU mode.

FW_CONFIG[169] (R/W)

BIT[0] : Update disable

0x0 : FW updates enabled.

0x1 : FW update disabled permanently

Bit	Field	Supportability
Bit[7:1]	Reserved	-
Bit[0]	Update disable	FW updates enabled (0x0)

FFU_STATUS[26] (R/W/E_P)

Using this field the device reports to the host the state of FFU process

Value	Description
0x13 ~ 0xFF	Reserved
0x12	Error in downloading Firmware
0x11	Firmware install error
0x10	General error
0x01 ~ 0x0F	Reserved
0x00	Success

OPERATION_CODES_TIMEOUT[491](Read Only)

Maximum timeout for the SWITCH command when setting a value to the MODE_OPERATION_CODES field. The register is set to '0', because the controller doesn't support MODE_OPERATION_CODES.

Value	Description	Timeout value
0x01 ~ 0x17	MODE_OPERATION_CODES_TIMEOUT = 100us x 2OPERATION_CODES_TIMEOUT	(Not defined)
0x18 ~ 0xFF	Reserved	-

MODE_OPERATION_CODES[29] (W/E_P)

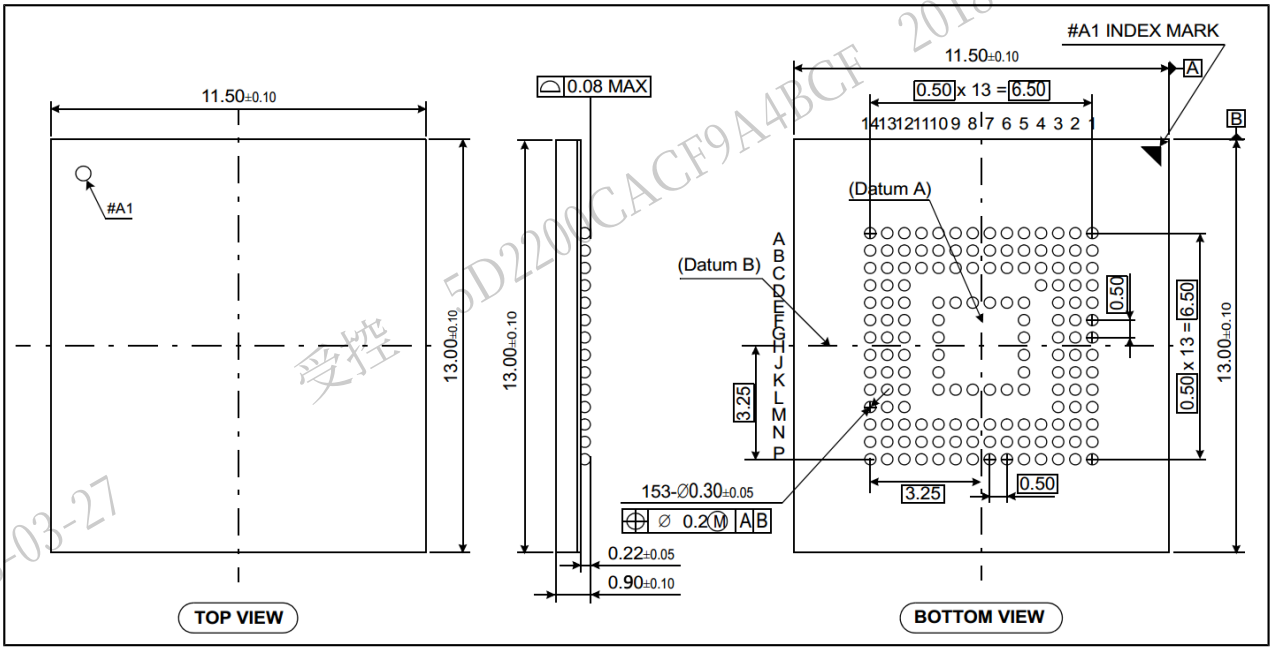
The host sets the operation to be performed at the selected mode, in case MODE_CONFIGS is set to FFU_MODE,MODE_OPERATION_CODES could have the following values :

Value	Description
0x01	FFU_INSTALL
0x02	FFU_ABORT
0x00, others	Reserved

7.14 S.M.A.R.T. Health Report

S.M.A.R.T. is a monitoring system that detects and reports on various indicators of eMMC reliability(Including original bad blocks, increased bad blocks, power-up number, power-loss counts and etc), with the intent of enabling the anticipation of hardware failures. We may be able to use recorded S.M.A.R.T. data to discover where the faults lie, ensure how to solve the problems and prevent them from recurring in future eMMC designs (For details, please refer to app note).

8. Package Dimension

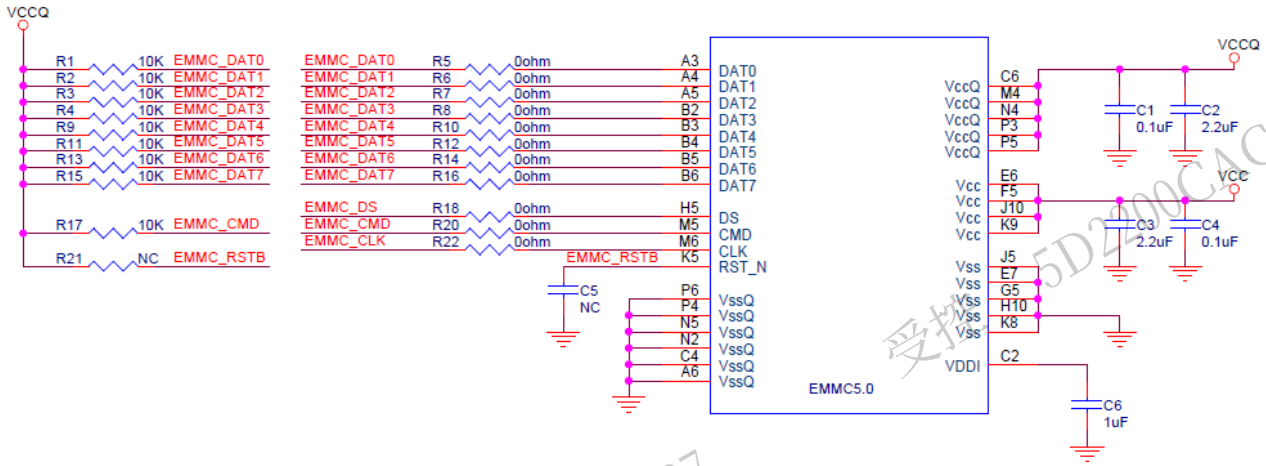


11.5mm x 13.0mm x 1.0mm Package Dimension

9 Connection Guide

9.1 Schematic Diagram

- Coupling capacitor should be connected with VCC/VCCQ and VSS as closely as possible.
- The resistance on the CLK line is highly recommended (0Ω by default). 0Ω~100Ω is also available.
- LONGSYS recommends to separate VCC and VCCQ power.
- VDDi Capacitor is min 0.1uF.
- LONGSYS recommends lay the VSS between the CLK and the Data lines.



The resistance on the CLK line is highly recommended (0Ω by default)

10. Processing Guide

It is recommended to follow the instructions of Moisture Sensitivity Level 3.

In the case of Pre-burn before SMT, It is highly recommended to limit the size of data pre-burned to the eMMC, please contact your agency for more information.

- The amount of data pre-burned (data written before SMT) is limited, it should be managed properly.
- Maximum size for the data-written to IDA.

Part Number	Size limited for Pre-burned Data
FSEWASLG-32G	9.5GB
FSEWASLG-64G	19GB
FSEWASLG-128G	38GB
